Readers are advised that there was an error in Figure 5 of this paper as published in issue 02/2011. The asterisk shown over the time point for month 6 should have actually been shown over the time point for month 2. The correct image is shown here.

**Fig. 5**
Graphical depiction of mean callus formation (± standard deviation) over the nine month in vivo period. Results are presented as a % of the original defect size (3 cm). Group 1: nine months no mesenchymal progenitor cells. Group 2: nine months + 225 x 10⁶ mesenchymal progenitor cells. Significant differences are represented by *.
